Expanding Medicaid in Tennessee:
Unlocking the Door to Health Insurance for African Americans

ISSUE BRIEF / SEPTEMBER 2014
Tennessee has the opportunity to accept federal Medicaid funds and extend much-needed health coverage to more than 339,000 low-income, uninsured adults. Of this population, 26 percent—more than 89,000 people—are African Americans.1

Accepting federal Medicaid funds would not only provide more than 89,000 African American Tennesseans with access to affordable health insurance, it would also be a critical step toward achieving health equity in the state. Compared to non-Hispanic whites, African Americans nationally have higher rates of several diseases—including diabetes, cervical cancer, and breast cancer—all of which can be ameliorated by access to health insurance.2

Working with Dr. Shun Zhang, a biostatistician with the National Center for Primary Care at Morehouse School of Medicine, Families USA examined key measures of health and access to health care from the U.S. Centers for Disease Control and Prevention’s Behavioral Risk Factor Surveillance System (BRFSS 2012). The data set compares access to health care and preventive health services for insured and uninsured low-income African Americans.

Our analysis found that uninsured, low-income, African American Tennesseans were more likely to report not seeing a doctor because of cost; more likely to report not having a regular doctor; and more likely to report missing an annual, routine check-up than their insured counterparts.

Findings from the BRFSS Data
The BRFSS database does not use federal poverty levels; therefore, we defined low-income individuals as any person with an annual income of $35,000 or less. This BRFSS income break approximates 138 percent of the federal poverty level for a family with between four and five people.

Our analysis provides a valuable picture of the health status of a low-income population that correlates to the Medicaid expansion population. Below are three core indicators of this population’s access to health care.

Three Core Health Indicators

**Could not see a doctor because of cost**

Sixty-one percent of uninsured, low-income African Americans reported that they could not see a doctor because of cost, whereas only 23 percent of insured, low-income African Americans reported the same outcome.

**No regular source of care**

Sixty-three percent of uninsured, low-income African Americans reported that they did not have a regular doctor, whereas only 24 percent of insured, low-income African Americans reported the same outcome.

**No access to a routine check-up**

Thirty-eight percent of uninsured, low-income African Americans reported that they had not had a routine check-up in the past year, whereas only 17 percent of insured, low-income African Americans reported the same outcome.
Other Notable Health Care Indicators
Below is one indicator of access to important preventive services.

No access to a screening mammogram
Sixty-one percent of uninsured, low-income, African American women who are more than 40 years old reported that they had not had a mammogram in the past two years, whereas only 24 percent of insured, low-income, African American women who are more than 40 years old reported the same outcome.

Tennessee’s Medicaid Expansion Option
The Affordable Care Act gives Tennessee and other states the option to provide Medicaid to residents with incomes up to 138 percent of the federal poverty level ($32,913 for a family of four in 2014). Twenty-seven states and the District of Columbia have decided to accept the federal dollars and expand Medicaid to their low-income, uninsured residents. Tennessee has not.

To be eligible for Medicaid in Tennessee, a family’s income must be no more than 110 percent of poverty ($26,235 annually for a family of four). Tennessee does not provide any Medicaid coverage to adults without dependent children.3

Tennessee: The Cost of Expanding Medicaid
If Tennessee expands Medicaid, the federal government will pay 100 percent of the cost through 2016, 95 percent in 2017, 94 percent in 2018, 93 percent in 2019, and 90 percent of costs in 2020. Tennessee will not have to pay more than 10 percent of the cost of providing hundreds of thousands of Tennesseans with affordable, quality health insurance.

New Jobs
If Tennessee expands Medicaid, the influx of new federal dollars will generate new jobs in the health care sector and other economic sectors. If Tennessee had expanded Medicaid in January 2014 when the option was first available, the influx of federal dollars would have supported approximately 21,900 jobs in 2016.4
Conclusion

There is no question that African American communities have a significant stake in the Medicaid expansion debate in Tennessee. The Medicaid expansion can unlock a door to the health care system for tens of thousands in African American communities across the state. For Tennessee, rejecting Medicaid expansion means leaving billions of federal Medicaid dollars on the table. Tennesseans who care about public health, economic growth, social justice, and health equity should tell their state leaders to move Tennessee forward by expanding Medicaid.

Working but Uninsured

Across the 23 states that have not expanded Medicaid, more than 80 percent of those who stand to gain coverage are either working or not in the workforce. Most—57 percent—are currently working or have worked within the last year. Twenty-four percent are classified as “not in the workforce” and include people with disabilities, students, non-working spouses, and people who have left the workforce.6
